Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in this application:

Listing of Claims

Claim 1 (currently amended): A reflected-light microscope comprising:

a light source serving to generate generating an illumination light beam of the reflected-light microscope that can be directed through a lens along an illumination beam path and onto a sample, the lens having a pupil plane and being disposed in a detection light path:

imaging optics disposed along the illumination beam path and having a focal corresponding plane which optically conjugates with corresponds to the pupil plane of the lens by being a Fourier plane of the focal plane of the lens; and

at least one attenuation element disposed in the focal corresponding plane of the imaging optics along the illumination beam path, the attenuation element comprising structure elements and reducing an illumination light power uniformly over an entire cross-section of the illumination light beam by means of the structure elements.

Claim 2 (previously presented): The reflected-light microscope according to claim 1, wherein at least one attenuation element comprises a grate structure or a sieve structure or a pinhole pattern.

Claim 3 (previously presented): The reflected-light microscope according to claim 1, wherein at least one attenuation element is a color filter.

Application No.: 10/538,522

Attorney Docket No.: 21295.0106US1 (E0664US)

Claim 4 (previously presented): The reflected-light microscope according to claim 1, wherein at least one attenuation element is a diffusion disk.

Claim 5 (previously presented): The reflected-light microscope according to claim 1, wherein at least one attenuation element is produced by lithography.

Claim 6 (previously presented): The reflected-light microscope according to claim 1, wherein at least one attenuation element is arranged in a storage mechanism.

Claim 7 (previously presented): The reflected-light microscope according to claim 6, wherein the storage mechanism is a turret or a push slide or a rotatable disk.

Claim 8 (previously presented): The reflected-light microscope according to claim 6, wherein the storage mechanism holds several attenuation elements that exhibit different degrees of attenuation.

Claim 9 (previously presented): The reflected-light microscope according to claim 6, wherein the storage mechanism has a neutral position that permits the illumination light beam to pass through without being attenuated.

Claim 10 (previously presented): The reflected-light microscope according to claim 6, wherein the storage mechanism has a blocking position that blocks the illumination beam path.

Claim 11 (previously presented): The reflected-light microscope according to claim 6, further comprising a drive mechanism that controls the storage mechanism.

Application No.: 10/538,522

Attorney Docket No.: 21295.0106US1 (E0664US)

Claim 12 (previously presented): The reflected-light microscope according to claim 11, wherein the drive mechanism comprises a stepping motor.

Claim 13 (previously presented): The reflected-light microscope according to claim 11, further comprising a control mechanism that controls the drive mechanism.

Claim 14 (previously presented): The reflected-light microscope according to claim 1, wherein the illumination light beam is automatically attenuated or blocked during lens changes.

Claim 15 (previously presented): The reflected-light microscope according to claim 1, further comprising at least one exchangeable optical element disposed in the illumination beam path, wherein the illumination light beam is automatically attenuated or blocked while the optical element is being exchanged.

Claim 16 (previously presented): The reflected-light microscope according to claim 1, wherein the reflected-light microscope is a fluorescence microscope.
